SUMMARY

Full-Stack JavaScript Developer with 1+ years of commercial freelance experience specializing in React, Next.js, TypeScript, and Node.js. Experienced in designing scalable web applications, frontend architecture, API integration, and collaborative development. Passionate about building high-performance, maintainable, and user-focused software.

TECH STACK

- **Frontend:** TypeScript, React, Next.js, Vue 3
- **Backend:** Node.js, Express.js, NestJS
- **Databases:** PostgreSQL, MySQL, Supabase
- **Styling:** Tailwind CSS, Bootstrap, Ant Design
- **Tools:** Git, Vite, Webpack, REST API, JWT, bcrypt

Education

MetaLabs
Fullstack Developer Program
2025

PROJECTS

«Smola flower» — Fullstack SPA | <https://smola-flower.vercel.app> | [Github](#)

Developed a full-stack e-commerce application using Next.js and NestJS with a modular architecture. Designed the frontend following Feature-Sliced Design (FSD) principles and implemented state management with Zustand and persistence. Integrated Supabase (PostgreSQL) and a Telegram bot (Telegraf) for order processing. Built a product catalog with filtering, recommendations, and full CRUD functionality with DTO validation, and wrote unit tests using Jest. Applied SSR and ISR rendering strategies to improve SEO and implemented secure client-server communication. Additional technologies: TypeScript, Tailwind CSS, Axios.

«PUBG weapons hub» — React SPA | <https://pubg-weaponshub.vercel.app> | [Github](#)

Developed an interactive SPA using Next.js (App Router), React, and TypeScript. Designed a weapon build configurator featuring a custom Score Engine based on a weighted multi-criteria scoring algorithm. Implemented a compatibility validation system for weapons and attachments, along with a comparison module for weapon performance across different engagement distances. Built a responsive UI with Tailwind CSS and integrated data visualization using Recharts. Optimized computational performance with React Hooks (useMemo).

«Paint.kg» — Legacy Bitrix MPA | <https://paint.kg> |

Refactored a legacy Bitrix-based application and transformed it into a full-featured B2B/B2C e-commerce platform. Implemented a hybrid content architecture by replacing part of the Bitrix information blocks with Google Sheets API as a headless CMS, using asynchronous data fetching via the Fetch API. Integrated the Telegram Bot API to process shopping cart orders. Improved UI/UX and optimized application performance. Deployed the application to a production server and ensured stable 24/7 operation. Tech stack: Bitrix, Vue 3, JavaScript (ES6+), HTML5, CSS3.

Interests: 3D-modeling, video games, piano, singing.
